Chatter OS - Bug Fix Report

Date: 25 October 2026 | Scope: server, website and sign-in | Every fix was checked twice

Summary. The full server and website code was reviewed twice. 48 issues were fixed and tested: 13 security issues, 14 server bugs, 17 website bugs, and 4 problems found during the second check. Three follow-up items are listed at the end.

Two changes users will notice: "Show QR" on the login screen now sends a 6-digit code by email first, and older chats are shown only to the account whose contact list includes them.

Test results

Check	Result	Done
Syntax check of every server file	Passed	☑
Website build (21 pages)	Passed, no errors or warnings	☑
Live checks on the server: sign-in, passkeys, webhook, reply delays	34 of 34 passed	☑
Account separation test on the real database (read only)	8 of 8 passed	☑
Wrong email code lockout test	Passed	☑
Instagram return address test	Passed	☑

Security fixes

#	What was fixed	Done
1	Anyone could get another account's authenticator secret from the login screen and sign in as them. The QR code now appears only after a 6-digit code sent by email is entered.	☑
2	A signed-in user could read, change or send messages in another account's chats.	☑
3	Saving, renaming or deleting a contact also changed or deleted other accounts' contacts with the same name.	☑
4	Deleting one account removed other accounts' contacts.	☑
5	Files that can run scripts (.html, .svg) could be uploaded. Uploads are now limited to GIF, PNG, JPG, WEBP and MP4.	☑
6	The Instagram connection token could be sent back to an outside website. It now goes only to the app's own sites.	☑
7	An account could enter another account's Instagram ID and receive its contacts.	☑
8	Email codes could be guessed without limit. A code is now cancelled after 5 wrong tries.	☑
9	Accounts that never confirmed their email could still sign in.	☑
10	The public status page showed a private webhook token and contact lists.	☑
11	Admin-only tools (test token, full history sync, graph sync) could be run by any user.	☑
12	Secret fallback values written in the code were removed.	☑
13	The website now accepts Instagram popup messages only from the app's own server.	☑

Server fixes

#	What was fixed	Done
14	The bot could send two replies to one message.	☑
15	Follow-up reminders ignored each account's pause, chat mode and business mode, and used the wrong voice.	☑
16	One failing contact stopped all follow-up reminders.	☑
17	Two quick first messages from a new person lost the second message.	☑
18	AI autofill for a contact always failed.	☑
19	Onboarding choices were saved to the wrong account's settings.	☑
20	Saving Settings showed the name with the surname twice (for example "John Doe Doe").	☑
21	Connected Instagram accounts showed as "not connected" when encryption was on.	☑
22	GIF search used another account's GIPHY key.	☑
23	Bad IDs or bad input caused server errors instead of clear messages.	☑
24	Asking for a new email code returned an error in the server logs every time.	☑
25	A contact name with symbols such as "(" crashed the search.	☑
26	Temporary memory kept growing while the cache server (Redis) was down.	☑
27	Older chats did not appear in their owner's inbox (51 chats are now visible again).	☑

Website fixes

#	What was fixed	Done
28	The Settings page kept loading forever.	☑
29	Admin pages could go blank after choosing a workspace.	☑
30	"Test My Clone" in Settings always showed an error.	☑
31	Adding or removing a passkey on the Profile page did nothing.	☑
32	The profile address was never saved, and unsaved typing was wiped.	☑
33	If loading failed, pressing Save could wipe Settings, the business policy or the storyboard. Saving is now paused until the data loads.	☑
34	"Saved" appeared even when saving failed.	☑
35	Error messages showed a tick icon and disappeared too early.	☑
36	The loading spinner stayed stuck when the Instagram popup was closed.	☑
37	Made-up AI replies hid real failures in the simulator and AI interview.	☑
38	The Feature Store page kept loading forever. It now has a Retry button.	☑
39	Four people were always listed as "close friends" for every account; the Online tab count did not match its list.	☑

#	What was fixed	Done
40	Select All / Clear All sent hundreds of requests and messages at once.	☑
41	Changes made on another device did not show up.	☑
42	Saving Settings marked Instagram as disconnected.	☑
43	Contact edits were saved in the browser under the wrong account.	☑
44	Smaller issues: onboarding chat mode, a silent workspace error, background requests while signed out.	☑

Found in the second check

#	What was fixed	Done
45	Older chats would have been locked away from their real owner.	☑
46	An account could claim another account's older chat by linking its ID.	☑
47	The 5th wrong code showed the wrong message.	☑
48	The Mac / Linux desktop app address for the Instagram popup was rejected.	☑

Follow-up items

#	Item	Done
49	Replace the Meta app secret in the Meta developer dashboard and update it on the server. The old value was in the code.	☐
50	Add a limit on wrong authenticator (OneAuth) codes at sign-in.	☐
51	Run the live checks again once the new version is live on the server.	☐
